

Update your extension

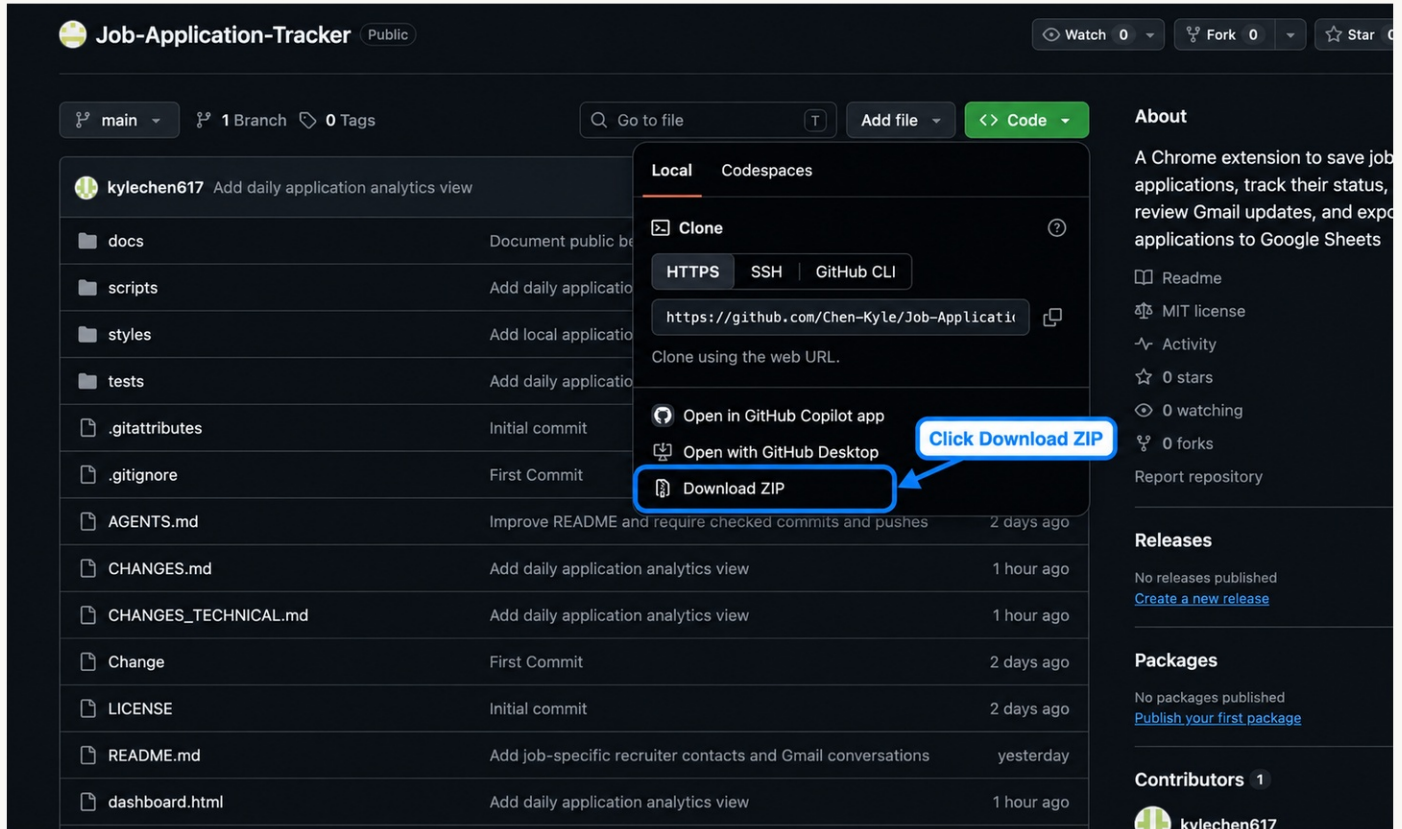

Chrome on a computer | About 3 minutes

1. Download the latest ZIP

Open the repository below. Click Code → Download ZIP.

Unzip the download. It is usually called Job-Application-Tracker-main.

Open GitHub repository

2. Replace the files in your existing extension folder

Find the folder you originally selected when installing the extension.

Copy the contents of the new unzipped folder into that existing folder.

Choose Replace for files with the same name.

Keep the original folder in the same location, with the same name.

Copy its contents—not the new folder itself—so folders are not nested.

Keep your existing installation

Do not click Remove in Chrome. Update the files, then reload as on page 2.

Your jobs and settings are stored in Chrome, separate from these files.

Chrome on a computer | About 3 minutes

3. Reload Job Application Tracker

Open `chrome://extensions` in Chrome. Turn on Developer mode if needed.

Find the Job Application Tracker card and click its circular Reload arrow.

Use the Reload arrow on that card—not Load unpacked or Remove.

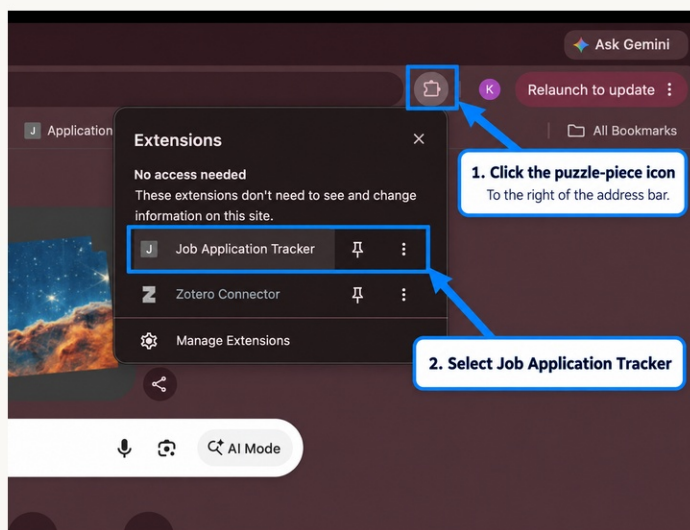

4. Reopen the dashboard

Close old dashboard tabs, then open the extension from the puzzle icon.

Click Open dashboard. You can also reopen your dashboard bookmark.

Please wait a moment if the extension menu takes a second to appear.

If the update did not appear

Check that you replaced files in the folder Chrome originally loaded.

Click the extension card's Reload arrow again, then reopen the dashboard.
